

## CANopen IO-X1 – Fact sheet

### Overview

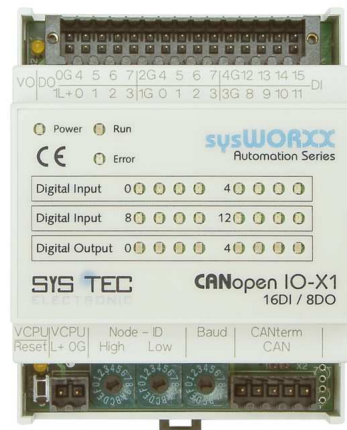

The CANopen IO-X1 is a very compact and cost effective CANopen IO module featuring a high-density of industrial proven I/O's.

The module includes a CPU-core including the pre-programmed firmware for CANopen communication and peripherals for the industrial inputs and outputs. Extensive diagnostic routines are implemented to ensure a most reliable and safe operation.

All inputs and outputs as well as configuration parameters are accessible via the CANopen protocol.

The CANopen IO-X1 is a CANopen slave device according CANopen device profile **CiA 401 DS V2.1** and CANopen communication profile **CiA 301 DS V4.02**.

Two LED indicate the device state according to **CiA 303-3 DR V1.0**.

**Hex-encoding Switches:**

Node ID:

Allows for configuration of node ID from 0x1 ... 0x7F (1..127 dec).  
When node-ID is set to value 0xFF, the device is reset to factory settings after power-on or reset.  
The node-ID is also configurable via LSS.

Baud rate:

Selectable via Hex-switch:  
0 = 1 Mbit/s  
1 = 800 kbit/s  
2 = 500 kbit/s  
3 = 250 kbit/s  
4 = 125 kbit/s  
5 = 100 kbit/s  
6 = 50 kbit/s  
7 = 20 kbit/s  
8 = 10 kbit/s

The baud rate is also configurable via LSS.

**PDO Mapping**

In standard configuration (factory settings) the digital output DO0..7 and the digital inputs DI0..15 are mapped to the following PDO's.

	ID	Length	BYTE 0	BYTE 1
1. RPDO	200H +Node ID	1	DO0_7 6200H/1	
1. TPDO	180H +Node ID	2	DI0_7 6000H/1	DI8_15 6000H/2

The PDO-mapping and linking can be changed dynamically by use of a standard CANopen configuration tool. By doing so, the 2nd TPDO and 2nd RPDO become available. The configuration can be saved to non-volatile memory and thus is available after restart.
